

# WELCOME TO 10 DAYS WEB DEVELOPMENT WORKSHOP

COVERS HTML, CSS AND BASIC JS

## #DAY8

 <https://tiny.cc/itsnpdiscord>

 [info@itsnp.org](mailto:info@itsnp.org)

## DAY 8 AGENDA

### JAVASCRIPT

objects (creating object, object literal, creating instance of object, object constructor, method in js object, Array (array literal, new keyword, array constructor, methods {concat, every, filter, find, findIndex, forEach, includes, indexOf, join, map, reduce, reverse, pop, push, shift, unshift, slice, sort, splice, toString, toLocaleString})).

# js object

- js object is a data type in JavaScript
- It contains properties and methods
- values in objects are represented as key:value pairs

# CREATING OBJECTS

- 1 object literal
- 2 creating instance of Object
- 3 using an object constructor

# OBJECT LITERAL

we can create objects using object literal

## SYNTAX

```
object = {  
  property1:value1,  
  property2:value2,  
  method: function() {  
    return something;  
  }  
}
```

# CREATING INSTANCE OF OBJECT

we can create instance of an object using `new` keyword as shown below

## SYNTAX

```
var objectname=new Object();
```

# USING OBJECT CONSTRUCTOR

we can create object using object constructor

## SYNTAX

```
function obj(p1, p2, p3){  
  this.p1=p1;  
  this.p2=p2;  
  this.p3=p3;  
}  
obj1=new obj(value1,value2, value3);
```

# METHOD IN OBJECT

we can create methods in object

## SYNTAX

```
const obj = {  
  p1: val1,  
  p2: function() {  
    return something;  
  }  
}
```

# Array

Array is an object which collects data

# CREATING ARRAYS

1

Array literal

2

creating instance of Array

3

using an array constructor

# ARRAY LITERAL

we can create arrays using array literal

## SYNTAX

```
let array = [val1, val2, val3];
```

# CREATING INSTANCE OF AN ARRAY

we can create instance of an array using `new` keyword as shown below

## SYNTAX

```
let arr = new Array();
```

# USING ARRAY CONSTRUCTOR

we can create array using array constructor

## SYNTAX

```
let arr = new Array(val1, val2, val3);
```

## SOME ARRAY METHODS

- **concat**: returns a merged array
- **filter**: filters and extracts the element that satisfies condition
- **forEach**: calls the specified function once for each array element
- **includes**: checks whether array contains specified element or not
- **indexOf**: searches the element and returns its index
- **reverse**: reverse the order of elements
- **sort**: sorts the element of an array
- **toString**: converts elements to string without affecting the array
- **push**: add element at the last
- **pop**: remove element from the last
- **shift**: removes element from the start
- **unshift**: adds element at the start

# Assignment

create an array of objects that consists of users name, age, favorite subject, and gender and create a new array of those whose favorite subject is math, create a new array of those who are greater than 20.

# THANK YOU!

DAY 8 WAS AWESOME HAVING YOU!  
HOPE WE GAVE THE BEST

## DAY 8 OVER
